

M2: Instructions to enable/disable unirgy module

Notes

As state in magento documentation

<https://devdocs.magento.com/guides/v2.3/extension-dev-guide/declarative-schema/db-schema.html#disable-a-module> modules disable will drop those modules' db tables, i.e. data will be lost. If you plan to restore it later don't forget to use `--safe-mode=1` option of `setup:upgrade` command or create db dump.

Disable

1. Truncate these tables (or remove rows with `udropship_vendor!=0`):
catalog_product_index_price, catalog_product_index_price_replica,
cataloginventory_stock_status, cataloginventory_stock_status_replica

```
truncate catalog_product_index_price;  
truncate catalog_product_index_price_replica;  
truncate cataloginventory_stock_status;  
truncate cataloginventory_stock_status_replica;
```

2. Collect modules to disable using this command

```
bin/magento module:status | grep Unirgy_
```

3. Disable unirgy modules using this command (replace `<modules to uninstall>` with actual module names returned by prev command)

```
bin/magento module:disable --clear-static-content <modules to  
uninstall>
```

4. Run `setup:upgrade` command

```
bin/magento setup:upgrade
```

5. Run `module:uninstall` command (replace `<modules to uninstall>` with actual module names returned in step 2 command)

```
bin/magento module:uninstall --non-composer <modules to uninstall>
```

6. Run reindex commands

```
bin/magento indexer:reset cataloginventory_stock catalog_product_price  
bin/magento indexer:reindex cataloginventory_stock  
catalog_product_price
```
